An article by Dr. Peter McNally in this issue of VHJOE demonstrates the Double Wire method for ERCP cannulation. This method can be used by experienced endoscopists as an aid in difficult bile duct cannulations. Visible Human models with the duodenal bulb cut away show the approximate positioning of the ERCP endoscope and the sequence of wire passage (pancreatic duct in green, common bile duct in purple).

Coronal and transaxial cross sections show the course of the bile duct relative to other internal structures. The pancreatic duct can be seen in these cross sectional with careful attention.

Video: Visible Human models and cross sectional anatomy around the common bile duct.
